Easy to own...
easy to install...
easy to maintain

The World's First Complete Fiberglass Composite
Arbor and Pergola System

Why fiberglass?

Stability

Fiberglass beams can span longer distances than wood or vinyl (typically up to 18 feet). Unlike wood, their high strength-to-weight ratio keeps them from sagging under their own weight. Unlike vinyl, they are unaffected by variations in temperature and will not sag in hot climates.

High strength-to-weight ratio

Pound for pound, our light weight fiberglass-reinforced components are stronger than steel. This allows for quick and easy installation by contractors or homeowners, without the need for cranes and large crews of workers.

Corrosion resistance

Fiberglass-reinforced composites are naturally corrosion resistant. They will not rust, corrode or pit regardless of the environment in which they are installed.

Consistency in appearance and performance

Compared to traditional materials, fiberglass components offer a uniform appearance the lasts for years. They will not twist, warp or bow after installation, and they maintain their full strength over the life of the product.

Ease of installation

Our arbors are normally custom fabricated to your specific dimensions, making installation easy and fast. Parts are clearly marked and all hardware is included so that your arbor can be easily assembled in very little time - most arbors can be completed in one day or less.

Lower “life cycle” cost than traditional materials

Over the life of the arbor, the durability and weather resistance of fiberglass components make our product a great investment. They are virtually maintenance free and will provide many years of enjoyment.

Design your own arbor

Visit arborsdirect.com and use our custom ArborBuilt software to create your perfect oasis. Chose from free-standing or attached designs, pick the size you need, select round or square column types, and in seconds you can have a detailed and dimensioned custom arbor designed for your specific application. Click the quote tab for detailed pricing information, then call 1-800-930-7495 for available discounts, shipping

information and other options, including custom paint applied at the factory. Our representatives can also assist you with any questions or special requirements you might have.

Paint and special coatings

Our fiberglass components hold paint extremely well, and because fiberglass is non-porous they will not absorb moisture - the number one cause of cracking and peeling. Components may be painted on site prior to installation, or painted at the factory prior to shipment. If you require a custom color, just provide a Sherwin Williams or Benjamin Moore color number or call us for more color matching options.

We also provide a new textured coating option. Applied at the factory, it resembles stucco and gives columns an "Old World" stone appearance.

Special applications

ArborsDirect arbor components can also serve as eye-catching accents for both residential and commercial structures. We will be happy to assist you in developing custom applications to fit your needs. With the durability and easy of fabrication inherent to fiberglass composite components, the only limit is your imagination.

Swing and accent arbors

The ArborsDirect swing arbor is the perfect touch to provide a relaxing focal point where space is limited. It comes complete with hardware to support the swing of your choice, and may be customized to fit your particular application.

Custom accent and entrance arbors add an elegant visual element in the yard, garden or pool side.

Quality and versatility

Not just for the backyard

Our manufacturing process and materials make ArborsDirect arbors and components the perfect choice for commercial applications as well. The extraordinary strength-to-weight ratio of our beams allows for clear spans of up to 18 feet, and components can be manufactured and configured to meet your exact design specifications. Our structures and architectural accents are great additions for retail developments, residential communities, recreational facilities and commercial properties - and their long life and low maintenance makes them a cost-effective and attractive addition to your project.

Quick and easy to install

ArborsDirect structures are completely fabricated and pre-cut at the factory, and all installation hardware is included. Most arbors can be installed by two people in less than a day, using commonly available tools. The light weight of our components make them easy to handle, and complete installation instructions are included with each unit. You can also download the installation instructions from our web site at www.arborsdirect.com to see for yourself how easy it is to assemble a beautiful, long-lasting ArborsDirect arbor.

Technology meets craftsmanship

We use state-of-the-art manufacturing technology and fiberglass composite materials to create structures of lasting value and beauty. ArborsDirect structural components are made using the pultrusion process, ensuring a consistently uniform and durable product. Our commitment to quality is second to none.
